

Communication

OptiCrop — Smart Agricultural Production Optimization Engine

Project Communication Summary

This project was completed solo after the originally assigned team did not actively participate. As communicated to the mentor, all planning, development, testing, and documentation were carried out independently, with regular self-review checkpoints at the end of each development phase (EDA, pre-processing, model building, application building) to verify correctness before proceeding to the next.

Mentor Communication

- Confirmed with mentor that solo completion is acceptable given team inactivity.
- Repository structure and submission format (this 8-folder template) confirmed directly with mentor before final submission.
- Final GitHub repository link and demo video link to be submitted via the official Google Form, as instructed.
