

Team Involvement in Demonstration

OptiCrop — Smart Agricultural Production Optimization Engine

Team Status

This project was originally assigned as a team project. As the assigned team lead and members did not actively participate, the project was completed solo, with mentor approval, in accordance with the program's policy allowing individual completion when a team is inactive.

Individual Contribution

All phases of the project — brainstorming, requirement analysis, design, planning, development (EDA, pre-processing, model building, application building), testing, documentation, and demonstration — were carried out individually by Neelima.

Demonstration

As a solo contributor, the project demonstration (screen recording) is presented entirely by the individual developer, covering all functional features and the underlying methodology.
